ME 3011 - Kinematics & Dynamics of Machines
Dr. Robert Williams
Abstract

Kinematic and Dynamic Analysis of an airplane’s landing gear is detailed. With 90,000 planes in the air at any given time perhaps the most crucial element for a safe return is the airplane landing equipment. This analysis is modeled on a one degree-of-freedom with one motor input. Complete position, velocity and acceleration analysis can be detailed for the gears entire range of motion, including a snapshot of a point of interest. The dynamic analysis details the input torque and the shaking force and moment acting on the ground link.

1 Introduction

A full kinematic and dynamic study of airplane landing gear will be detailed. This includes position, velocity and acceleration analysis of the full range of motion of the landing gear system.

2 Background

Airplane landing gear, much like the airplanes that they find themselves on are not entirely alike and can be quite complex. This model will be representing a very simple four bar model to simulate the motion of the ascension and retraction of the landing gear system. A real-life version of an example of this kind of airplane landing gear is shown in Figure 1.

Figure 1 Real World Landing Gear Mechanism
3 Kinematic Diagram

A kinematic diagram is essential to describing how this mechanism will move. In Figure 2 the linkage lengths are denoted by \( r_i \) and the angle between the x axis and the lengths by \( \theta_i \). The angular velocities are denoted by an \( \omega_i \) and the angular acceleration is described by \( \alpha_i \).

To begin our analysis, we will need to quantify the input values for position, velocity and acceleration. These values can be found listed in Table 1.

<table>

<td>-0.2303 rad/s^2</td>
</tr>
</tbody>
</table>
3.1 Mobility and Degrees of Freedom

The degrees-of-freedom (dof) of a device describes the number of ways that it can move. From our understanding of the landing gear mechanism, a dof of 1 is desired. This is implied by the name, as a mechanism is a device that has one and only one degree-of-freedom. We can ensure that this is in fact the case by using Kutzbach’s Mobility Equation (EQ.1) for Planar Jointed Devices to confirm the dof.

\[ M = 3(N - 1) - 2J_1 - J_2 \] (EQ.1)

In this Mobility Equation we have several variables to define. \( N \) will be the number of links and will include the ground link. The number of one dof joints will be \( J_1 \) (ex. revolute or prismatic joints) and the number of two dof joints (ex. Cam or gear joints) will be \( J_2 \).

The landing gear mechanism that is being analyzed will have a total number of links of 4. Additionally, the mechanism will be entire comprised of 4 revolute joints or \( J_1 \). It can be proven that the mobility will be 1, just as we were expecting.

\[ M = 3(4 - 1) - 2 * 4 - 0 = 1 \]

3.2 Grashof Analysis

Some four bar mechanisms are somewhat unique in that we can predict the nature of the rotation of the input and output links using the ground link location and the length of the links. When analyzed two outcomes can be determined: a link can be considered a crank which has full rotatability or a rocker that will have a limited range of rotatability.

To determine whether our landing gear can be considered a Grashof Mechanism, we will need understanding of Grashof’s Law. Begin by considering the longest link as \( L \), the shortest link as \( S \), and the two-intermediate links as \( P \) and \( Q \). To qualify as a Grashof Mechanism, \( L + S < P + Q \).

\[ \text{We have: } 32 + 12 < 30 + 26 \]

Now that we have qualified as a Grashof Mechanism, we can begin to investigate the kinematic inversion that fits our mechanism. We know that our shortest link \( S \), is going to be adjacent to the ground link for in mechanism. According to Grashof, we can expect to have an input of a crank and an output of a rocker.
3.3 Limits of Landing Gear

While it is possible to have an output of a crank-rocker, we cannot expect this in our real-life mechanism. When the landing gear is lowered, the wheels will need to make a 90-degree contact with the ground to safely support the weight of the aircraft. Inversely, when the gear is raised it will need to be tucked into the airplane to give better performance and fuel economy. Therefore, we can consider the limits of the input angle as shown in our kinematic diagram in Section 3 as $360 > \theta > 236.09$.

3.4 Position, Velocity and Acceleration Inputs

When we look at a snapshot of this mechanism and analyze the kinematics, we want to be sure that the inputs we choose are meaningful. The position input represented here by $\theta_2$, is limited due to factors described in Section 3.3. It can be assumed that the kinematics at the halfway point between the fully extended and the fully retracted will be a point experiencing a unique velocity and acceleration. For this position we will consider $\theta_2 = 315^\circ$.

The input velocity will also need to be estimated. We estimate that a typical landing gear system will take about 5 seconds to retract and will travel 26 inches in our mechanism as shown in the kinematic diagram in Figure 1. Given a cycloidal input for the rotational acceleration, the input now is $\omega_2 = 0.824 \, \frac{rad}{s}$.

Finally, we can expect this mechanism to have an acceleration as it ascends and retracts. Following the same cycloidal function, we can expect $\alpha_2 = -0.2303 \, \frac{rad}{s^2}$. 
4 Kinematic Analysis

4.1 Position Analysis

When we begin our position analysis of this mechanism, we will need to begin by defining our givens and our desired values. These values are summarized in Table 2.

<table>
<thead>
<tr>
<th>Given</th>
<th>( r_1, r_2, r_3, r_4, \theta_1, \theta_2 )</th>
</tr>
</thead>
<tbody>
<tr>
<td>Find</td>
<td>( \theta_3, \theta_4 )</td>
</tr>
</tbody>
</table>

We can then derive our Vector Loop Diagram shown in Figure 3 and the Vector Loop Eq (VLE) in Equation 2.

\[ \text{Vector Loop Equation: } r_2 + r_3 = r_1 + r_4 \text{ (EQ 2)} \]

The derivation of \( \theta_4 \) can be found in appendix A and the resulting Equation 4 is shown reproduced below. We can plug our given values into G, F, and E from Table 2 and solve for \( t \) from equation 3.

\[
E = 2r_4 (-r_1 c_1 - r_2 c_2) = 2 \times 26(-32 \times \cos 0^\circ - 12 \times \cos 315^\circ) = -2105.23 \\
F = 2r_4 (r_1 s_1 - r_2 s_2) = 2 \times 26(32 \times \sin 0^\circ - 12 \times \sin 315^\circ) = 441.23 \\
G = r_1^2 + r_4^2 + r_2^2 - r_3^2 + 2r_1 r_2 \cos(\theta_1 + \theta_2) \\
= 32^2 + 26^2 + 12^2 - 30^2 + (2 \times 32 \times 12 \times \cos(0^\circ + 315^\circ)) = 1487.06
\]
We will only look at the positive open branch, therefore only 1 t.

\[ t_1 = \frac{-F \pm \sqrt{F^2 - G^2 + E^2}}{(G - E)} = \frac{-441.23 - \sqrt{441.23^2 - 1487.06^2 + (-2105.23)^2}}{(1487.06 - (-2105.23))} = -0.555 \]

Now we can plug in for \( \theta_4 \):

\[ \theta_4 = 2 \tan^{-1}(t) = 2 \tan^{-1}(-0.555) = -58.1^\circ = 301.9^\circ \]

We can now use equation # to solve for \( \theta_3 \):

\[ \theta_3 = \tan^{-1} \frac{-r_1s_1 - r_4s_4 + r_2s_2}{-r_1c_1 + r_4c_4 - r_2s_2} = \tan^{-1} \frac{-32 \sin(0^\circ) - 26 \sin(-58.1^\circ) + 12 \sin(315^\circ)}{-32 \cos(0^\circ) - 26 \cos(-58.1^\circ) - 12 \cos(315^\circ)} \]

\[ \theta_3 = -26.92^\circ \]
4.1.1 Graphic Solution

A graphic solution of the derived solutions from section 4.1 can be shown. The solution detailing this landing gear mechanism can be found in Figure 4.

![Figure 4: Graphical Solution Representation of the Landing Gear Mechanism](image)

4.1.2 Using MATLAB to Show a Point of Interest

It can be considered that the most import point on this mechanism as the connection point between the traditional four bar mechanism and the wheel. This point can be found at the intersection of the $r_3$ and $r_4$. If this point is defined the MATLAB code and just how this point will move over time is shown. Figure 6 shows this result using the MATLAB Code in Appendix E.
4.2 Velocity Analysis

Much like the position analysis, we will start again by defining our givens and our desired values. These values for velocity are summarized in Table 3.

<table>
<thead>
<tr>
<th>Given</th>
<th>( r_1, r_2, r_3, r_4, \theta_1, \theta_2, \theta_3, \theta_4, \omega_2 )</th>
</tr>
</thead>
<tbody>
<tr>
<td>Find</td>
<td>( \omega_3, \omega_4 )</td>
</tr>
</tbody>
</table>

Using the derivation from Appendix B, we can label our constants and solve for \( \omega_4 \) from equation 5.

\[
a = r_3 s_3 = 30 \sin(-26.9^\circ) = -13.6 \quad b = r_4 s_4 = 26 \sin(301.9^\circ) = -22.07
\]

\[
d = -r_3 c_3 = 30 \cos(-26.9^\circ) = -26.75 \quad e = r_4 c_4 = 26 \cos(301.9^\circ) = 13.74
\]

\[
c = r_2 \omega_2 s_2 = 12 \times 0.824 \times \sin(315^\circ) = -6.992 \quad f = r_2 \omega_2 c_2 = 12 \times 0.824 \times \cos(315^\circ) = 6.992
\]

\[
\omega_4 = \frac{af - dc}{ae - db} = \frac{(-13.6)(-6.992) - (-26.75)(-6.992)}{(-13.6)(13.74) - (-26.75)(-22.07)} = 0.363
\]

Now we can solve for \( \omega_3 \) using equation 6.
\[
\omega_3 = \frac{ce - bf}{ae - db} = \frac{(-6.992)(13.74) - (-22.07)(6.992)}{(-13.6)(13.74) - (-26.75)(-22.07)} = -0.0749
\]

4.3 Acceleration Analysis

As with both the Position and Velocity Equations, the givens and desired values can be found in Table 4.

| Table 4: Acceleration Analysis Given and Desired Values |
|---|---|
| Given: | \(r_1, r_2, r_3, r_4, \theta_1, \theta_2, \theta_3, \omega_2, \omega_3, \omega_4, \alpha_2\) |
| Find: | \(\alpha_3, \alpha_4\) |

Now using the derivation from Appendix C, we can label our constants and solve for \(\alpha_4\) from equation 6.

\[
a = r_3s_3 = 30 \times \sin(-26.3^\circ) = -13.6 \quad b = r_4s_4 = 26 \times \sin(301.9^\circ) = -22.07
\]

\[
d = -r_3c_3 = -30 \times \cos(-26.3^\circ) = -26.75 \quad e = r_4c_4 = 26 \cos(301.9^\circ) = 13.74
\]

\[
c = r_2a_2s_2 + r_2\omega_2^2c_2 - r_3\omega_3^2c_3 - r_4\omega_4^2c_4
\]

\[
= 12 \times (-0.2303) \times \sin(-26.3^\circ) + 12 \times (0.82404^2) \times \cos(315^\circ) + 30 \times (-0.075^2) \cos(-26.3^\circ) + 26 \times (-0.363^2) \cos(301.9^\circ) = 5.7543
\]

\[
f = r_2a_2c_2 - r_2\omega_2^2s_2 - r_3\omega_3^2s_3 + r_4\omega_4^2s_4
\]

\[
= 12 \times (-0.2303) \cos(315^\circ) - 12 \times (0.82404^2) \sin(315^\circ) + 30 \times (-0.075^2) \sin(-26.3^\circ) - 26 \times (-0.363^2) \sin(301.9^\circ) = 0.9739
\]

\[
\alpha_4 = \frac{af - dc}{ae - db} = \frac{(-22.07 \times 0.9739) - (-26.75 \times 5.7543)}{(-13.6 \times 13.74) - (-22.07 \times -26.75)} = -0.181
\]

And now we can solve for \(\alpha_3\) with equation 7:

\[
\alpha_3 = \frac{ce - bf}{ae - db} = \frac{(5.7543 \times 13.74) - (-22.07 \times 0.9739)}{(-13.6 \times 13.74) - (-22.07 \times -26.75)} = -0.1294
\]
5 MATLAB Results and Discussion

An analysis was also completed in MATLAB and can be compared to the results of the subsequent sections. The complete MATLAB code can be found in Appendix D. A full range of motion of the mechanism was animated to the screen and can be seen in Figure 5.

![Landing Gear Animation](image)

*Figure 5 Landing Gear Mechanism Animation*

This full range of motion diagram also provides support for the input $\theta_2$ angles determined in section 3.4. It should also be noted that to make the gear retract to a perfectly straight alignment the ground link $r_1$ will need to be lengthened.

A plot comparing the input angle, velocity and acceleration can be seen in Figure 6. The input lengths will need to be modeled as a sinusoidal wave to avoid the intense loads at the start and end of the mechanisms motion. This is especially crucial in that of landing gear, as meaningful data will be needed to ensure that there’s appropriate factors of safety.
5.1 Position Graphs

When modeled in MATLAB the $\theta$ values can be plotted in comparison to each other. These graphs represent much of how we would expect these angles to move Figure 7. The $\theta_3$ will start by swinging open briefly and then will gradually decrease to the final retracted position. Additionally, $\theta_4$ will increase as this is the arm directly in line with the landing gear wheel. These angles are limited by the dimensions of the links.
5.2 Velocity Graphs

The angular velocity values for Link 3 and 4 are shown in comparison to input angle $\theta_2$ in Figure 8. A few trends in these graphs represent real life phenomenon. Both $\omega_3$ and $\omega_4$ start and end at 0, showing that this model will both begin at rest and will end at rest as well. The representation of $\omega_3$ shows a sign change which corresponds to the links rotation, during the beginning of the cycle the link is in the negative x values and at the end is in the positive x position. This graph also reaffirms that $\omega_4$ id moving in the path on the positive x axis. Both exhibit a gradual increase and decrease in speed, which is desirable because of the adverse effects of the momentum of the mechanism on the rest of the aircraft.
5.3 Acceleration Graphs

Angular acceleration, $\alpha_3$ and $\alpha_4$, are modeled throughout the cycle in Figure 9. Similarly to the velocity and analysis, both links begin and end at rest as desired. The accelerations follow suit as having a gradual increase and decrease which help to offset any momentum effects on the aircraft.
5.4 Methodology Comparisons

With the various methods of analysis now modeled in previous sections, Graphical Solution (Section 4.1.1), Snapshot Calculations (Sections 4.1, 4.2, 4.3) and the MATLAB Results (Section 5), we can compare them. The largest percent difference between the graphical solution and snapshot calculations for $\theta_3$ and $\theta_4$ is 4.6%. Similarly, the largest percent difference between the snapshot calculations and the MATLAB solution is 2.2%. Overall, this shows a very precise set of data and adds to the credibility of the results.

6 Inverse Dynamics Problem Statement

If given the mechanism, the external forces and moments acting on the mechanism and the mechanism motion we can find the required driving force and the internal joint forces. A tabulated chart for the given and desired values can be found in Table 6.

<table>
<thead>
<tr>
<th>Given</th>

</tbody>
</table>

6.1 Center of Gravity Estimation

Center of gravity of the links is essential for the inverse dynamics portion of the analysis and will decide where the weight of each link will be acting. This will be assumed as being at the exact midpoint of the links, as shown in Table 7. This means that the angle between the link and the moment arms of the forces will be precisely 0°. This assumption will provide a benefit to the project as the absence of more complicated geometry of the links will make computations easier.

It can be estimated that the moment differences caused by the weight and external forces will be negligible for this analysis. It is important however, to acknowledge that the information gained can be useful if this project we’re to be continued in the future, especially if designing landing gear for commercial use.

6.2 Mass Estimation

Finding direct schematics for a possible retractable landing gear mechanism will require more research time that will is not available with this report. In absence of this, an approximate
representation is given for the link diameters and material used in the manufacturing. An example of the landing gear this attempts to model is found in Figure 10.

![Figure 10 The Approximate size of the landing gear modeled.](image)

The masses will be determined using the volume that the links fill and the density of the material chosen. This will provide the best representation outside of having an actual physical mechanism to measure and weigh.

### 6.3 Mass Moment of Inertia

The links are assumed to have a slender rectangular cross section in the 2D plane that our analysis is occurring. As provided in the Mechanism Kinematics & Dynamics NotesBook, Figure 11 shows the assumed profile of each link. Around the centroid of a rectangular cross section the mass moment of inertia is defined in the equation: 

$$I_{GZ} = \frac{m \cdot l^2}{12}$$
6.4 Calculations and Tabulation

A common material for landing gear is high strength steel. This is for a few reasons, the first of which is that steel will have a very high strength which is required to support the weight of the aircraft. Steel is also resistant to fatigue or the cyclical loading of stress, such as turbulence in the air or from the jostling of an uneven landing strip. AISI 4340 Steel is assumed for the landing gear components and the material information from Matweb [5] is provided in Table 8.

Table 8 AISI 4340 Steel Material Properties

<table>
<thead>
<tr>
<th>AISI 4340 Steel Normalized, 4 in Round</th>

<th>Brinell Harness</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>161</td>
<td>0.284</td>
<td>321</td>
</tr>
</tbody>
</table>

Each link will be considered to have a circular cross section with a diameter of 4 inches and will provide a cylindrical volume. This can then be multiplied by the density to give the mass of the link which can be factored into the inverse dynamics’ analysis. Since link 1 is going to be considered the ground link we do not need the mass and the mass moment of inertia, and it will not be included. Table 9 summarizes the results shown in Appendix G.

7 Inverse Dynamics Analysis

Building upon the Kinematic Analysis, this Inverse Dynamics section will show the forces and torques acting on the mechanism. For this analysis, it is considered that the mechanism to be tested in a laboratory setting and no external forces either from the plane weight or the wind resistance acting of the links. That is to say, $F_e$ and $M_e = 0$.

A snapshot calculation has also been completed to confirm the values determined by the MATLAB Code. This snapshot calculation will build upon previous calculations determined in subsequent sections, a table of these values is reproduced in Table 10.

7.1 Link 2 Details

Using the equations from Appendix H, the details for link 2 can be shown as:

$$r_{12} = \begin{pmatrix} r_{12x} \\ r_{12y} \end{pmatrix} = \begin{pmatrix} -6 \cdot \cos(\theta_2) \\ -6 \cdot \sin(\theta_2) \end{pmatrix}$$

$$r_{32} = r_{12} + r_2 = \begin{pmatrix} -6 \cdot \cos(\theta_2) + 12 \cdot \cos(\theta_2) \\ -6 \cdot \sin(\theta_2) + 12 \cdot \sin(\theta_2) \end{pmatrix}$$

$$A_{g2} = \begin{pmatrix} A_{g2x} \\ A_{g2y} \end{pmatrix} = \begin{pmatrix} -6 \cdot \alpha_2 \cdot \sin(\theta_2) - 6 \cdot \omega_2^2 \cdot \cos(\theta_2) \\ 6 \cdot \alpha_2 \cdot \cos(\theta_2) - 6 \cdot \omega_2^2 \cdot \sin(\theta_2) \end{pmatrix}$$

7.1.1 Link 2 Snapshot Analysis

$$r_{12} = \begin{pmatrix} r_{12x} \\ r_{12y} \end{pmatrix} = \begin{pmatrix} -6 \cdot \cos(315°) \\ -6 \cdot \sin(315°) \end{pmatrix} = \begin{pmatrix} -4.24 \\ 4.24 \end{pmatrix}$$

$$r_{32} = r_{12} + r_2 = \begin{pmatrix} -6 \cdot \cos(315°) + 12 \cdot \cos(315°) \\ -6 \cdot \sin(315°) + 12 \cdot \sin(315°) \end{pmatrix} = \begin{pmatrix} 4.245 \\ -4.245 \end{pmatrix}$$

$$A_{g2} = \begin{pmatrix} A_{g2x} \\ A_{g2y} \end{pmatrix} = \begin{pmatrix} -6 \cdot \alpha_2 \cdot \sin(315°) - 6 \cdot \omega_2^2 \cdot \cos(315°) \\ 6 \cdot \alpha_2 \cdot \cos(315°) - 6 \cdot \omega_2^2 \cdot \sin(315°) \end{pmatrix} = \begin{pmatrix} -3.858 \\ 1.9039 \end{pmatrix}$$
7.2 Link 3 Details

Using the equations shown in Appendix H, the details equation can be shown as:

\[ r_{23} = \frac{r_{23x}}{r_{23y}} = \begin{pmatrix} -15 \cos (\theta_3) \\ -15 \sin (\theta_3) \end{pmatrix} \]

\[ r_{43} = \frac{r_{43x}}{r_{43y}} = \begin{pmatrix} -15 \cos (\theta_3) + 30 \cos(\theta_3) \\ -15 \sin (\theta_3) + 30 \sin(\theta_3) \end{pmatrix} \]

\[ A_{g3} = \begin{pmatrix} A_{g3x} \\ A_{g3y} \end{pmatrix} = \begin{pmatrix} -12 \alpha_2 \sin(\theta_2) - 12 \omega_2^2 \cos(\theta_2) - 15 \alpha_3 \sin(\theta_3) - 15 \omega_3^2 \cos(\theta_3) \\ 12 \alpha_2 \cos(\theta_2) - 12 \omega_2^2 \sin(\theta_2) + 15 \alpha_3 \cos(\theta_3) - 15 \omega_3^2 \sin(\theta_3) \end{pmatrix} \]

7.2.1 Link 3 Snapshot Analysis

\[ r_{23} = \frac{r_{23x}}{r_{23y}} = \begin{pmatrix} -15 \cos (-26.3) \\ -15 \sin (-26.3) \end{pmatrix} = \begin{pmatrix} 13.446 \\ 6.648 \end{pmatrix} \]

\[ r_{43} = \frac{r_{43x}}{r_{43y}} = \begin{pmatrix} -15 \cos (-26.3) + 30 \cos(-26.3) \\ -15 \sin (-26.3) + 30 \sin(-26.3) \end{pmatrix} = \begin{pmatrix} -13.448 \\ -6.441 \end{pmatrix} \]

\[ A_{g3} = \begin{pmatrix} A_{g3x} \\ A_{g3y} \end{pmatrix} = \begin{pmatrix} -12 \alpha_2 \sin(315) - 12 \omega_2^2 \cos(315) \\ 12 \alpha_2 \cos(315) - 12 \omega_2^2 \sin(315) \end{pmatrix} = \begin{pmatrix} 8.536 \\ 1.997 \end{pmatrix} \]

7.3 Link 4 Details

Using the equations derived in Appendix H, the details equation can be shown as:

\[ r_{14} = \frac{r_{14x}}{r_{14y}} = \begin{pmatrix} -13 \cos (\theta_4) \\ -13 \sin (\theta_4) \end{pmatrix} \]

\[ r_{34} = r_{14} + r_4 = \begin{pmatrix} -13 \cos (\theta_4) + 26 \cos(\theta_4) \\ -13 \sin (\theta_4) + 26 \sin(\theta_4) \end{pmatrix} \]

\[ A_{g4} = \begin{pmatrix} A_{g4x} \\ A_{g4y} \end{pmatrix} = \begin{pmatrix} -13 \alpha_4 \sin(\theta_4) - 13 \omega_4^2 \cos(\theta_4) \\ 13 \alpha_4 \cos(\theta_4) - 13 \omega_4^2 \sin(\theta_4) \end{pmatrix} \]
7.3.1 Link 4 Snapshot Analysis

\[ r_{14} = \begin{pmatrix} r_{14x} \\ r_{14y} \end{pmatrix} = \begin{pmatrix} -13 \ast \cos (301.9) \\ -13 \ast \sin (301.9) \end{pmatrix} = \begin{pmatrix} -6.8697 \\ 11.037 \end{pmatrix} \]

\[ r_{34} = r_{14} + r_4 = \begin{pmatrix} -13 \ast \cos (301.9) + 26 \ast \cos (301.9) \\ -13 \ast \sin (301.9) + 26 \ast \sin (301.9) \end{pmatrix} = \begin{pmatrix} 6.8696 \\ -11.0366 \end{pmatrix} \]

\[ A_{g4} = \begin{pmatrix} A_{g4x} \\ A_{g4y} \end{pmatrix} = \begin{pmatrix} -13 \ast -0.181 \ast \sin (301.9) - 13 \ast 0.363^2 \ast \cos (301.9) \\ 13 \ast -0.181 \ast \cos (301.9) - 13 \ast 0.363^2 \ast \sin (301.9) \end{pmatrix} = \begin{pmatrix} -2.903 \\ 0.211 \end{pmatrix} \]

7.4 Matrix Solutions

Sections 7.1 – 7.3 details 9 equations and for our inverse dynamics problem we have a total of 9 unknowns (Table #). This means that a real solution can be determined and a way to handle these solutions efficiently is to utilize a matrix solution.

As detailed in Appendix I, the \([A]\) matrix can be shown as:

\[
[A] = \begin{pmatrix}
-1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & -1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\
-4.24 & 4.24 & 4.245 & -4.245 & 0 & 0 & 0 & 0 & 1 \\
0 & 0 & -1 & 0 & 1 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & -1 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 6.648 & -13.446 & 6.441 & -13.448 & 0 & 0 & 0 \\
0 & 0 & 0 & -1 & 0 & 1 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & -1 & 0 & 1 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & -1 & 0 & 1 & 0 \\
0 & 0 & 0 & 0 & -11.03 & -6.87 & -11.04 & -6.87 & 0
\end{pmatrix}
\]

Additionally, the known matrix \({b}\) can be described as:

\[
{b} = \begin{pmatrix}
-0.42769 \\
43.05 \\
-0.02552 \\
-2.36802 \\
107.74 \\
-0.22365 \\
-0.69769 \\
92.92 \\
-0.204228
\end{pmatrix}
\]
After performing the Inverse Matrix Solution in a separate MATLAB program and given in Appendix K, our unknowns at a snapshot are determined to be:

\[ F_{12x} = -45.1402 \]
\[ F_{12y} = -119.6602 \]
\[ F_{32x} = -45.5679 \]
\[ F_{32y} = -76.6102 \]
\[ F_{43x} = -47.9359 \]
\[ F_{43y} = 31.1298 \]
\[ F_{14x} = -48.6336 \]
\[ F_{14y} = 124.0498 \]
\[ T_2 = 834.5850 \]

7.5 Solution Discussion

It is important to acknowledge that these values do not align with the Full Range of Motion Code (FROM) discussed in Section 8. After troubleshooting, the \( \{b\} \) matrix is confirmed to be the exact same as the FROM code but the \([A]\) matrix is unable to be confirmed with the code setup. For this reason, it is believed that the error is originating from here. It is believed that the MATLAB Code for FROM is the more reliable of the two sources because of the exact values that is used in calculations.
8 MATLAB Inverse Dynamics Results and Discussion

8.1 Input Torque

After solving using Matrix Inversion, the input torque can be determined. This input torque shown in Figure 12, shows the amount to torque needed to dive the mechanism to its retracted position. This is crucial when determining what type of motor is needed and how much power it will require.

![Torque vs. θ₂](image)

*Figure 12: Driving Torque, Average Torque and Root-Mean-Squared Torque VS Input Angle*

8.2 Shaking Moment Force and Moment

The shaking force and moment relate to the reaction force of the ground link r₁. This is especially important in this case, as the ground link is designed to be attached to an aircraft. If the aircraft cannot withstand the reaction forces, the mechanism can become misaligned, putting those on board in danger. The MATLAB results of these forces and moments, is shown in Figure 13.
Figure 13: Shaking Force and Moment compared to Input Angle
9 Further Development

While the work presented in this report is to be best of the author’s ability, if given the chance for further development a few things could be pursued. Firstly, a redesign of the link lengths will provide a more aerodynamic design. Secondly, some of the MATLAB results and snapshot results do not align exactly, and more time could work out those bugs. Lastly, some of the external forces that could present themselves during use could be included and would inevitably make the problem both more difficult and more useful.
10 References

Appendix A: Position Analysis Mathematics

Given: \( r_1 = 32, r_2 = 12, r_3 = 30, r_4 = 26, \theta_1, \theta_2 \)

Find: \( \theta_3, \theta_4 \)

X & Y Components

\( x) r_2 \cos \theta_2 - r_3 \cos \theta_3 = -r_1 \cos \theta_1 + r_4 \cos \theta_4 \)

\( y) -r_2 \sin \theta_2 - r_3 \sin \theta_3 = -r_1 \sin \theta_1 - r_4 \sin \theta_4 \)

Square

\( x) (r_3 c_3)^2 = (r_1 c_1)^2 + (r_4 c_4)^2 + (r_2 c_2)^2 - 2 * r_1 c_1 r_4 c_4 - 2 * r_4 c_4 r_2 c_2 + 2 * r_1 c_1 r_2 c_2 \)

\( y) (r_3 s_3)^2 = (r_1 s_1)^2 + (r_4 s_4)^2 + (r_2 s_2)^2 + 2 * r_1 s_1 r_4 s_4 - 2 * r_4 s_4 r_2 s_2 - 2 * r_2 s_2 r_1 s_1 \)

Add X & Y, using trig identity.

\( r_3^2 = r_1^2 + r_2^2 + r_4^2 c_2 c_2 + 2 r_4 c_4 (-r_1 c_1 - r_2 c_2) + 2 r_4 s_4 (-r_1 s_1 - r_2 s_2) + 2 r_1 r_2 (c_1 c_2 - s_1 s_2) \)

Simplify, Let:

\[ E = 2 r_4 (-r_1 c_1 - r_2 c_2) \quad (EQ \#4) \]

\[ F = 2 r_4 (r_1 s_1 - r_2 s_2) \]

\[ G = r_1^2 + r_4^2 + r_2^2 - r_3^2 + 2 r_1 r_2 \cos(\theta_1 + \theta_2) \]

Now we have:

\[ E \cos \theta_4 + F \sin \theta_4 + G = 0 \]

Use:

\[ t = \tan \frac{\theta_4}{2} \quad \text{so,} \quad \cos \theta_4 = \frac{1 - t^2}{1 + t^2} \quad \text{and} \quad \sin \theta_4 = \frac{2 t}{1 + t^2} \]

Therefore:

\[ E \frac{1 - t^2}{1 + t^2} + F \frac{2 t}{1 + t^2} + G = 0 \]

\[ E (1 - t^2) + F (2 t) + G (1 + t^2) = 0 \]

\[ E - E t^2 + F 2 t + G + G t^2 = 0 \]

\[ (G - E) t^2 + 2 F (t) + (G + E) = 0 \]

Use Quadratic Equation

\[ x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} \]

\[ t_{1,2} = \frac{-2F \pm \sqrt{(2F)^2 - 4(G - E)(G + E)}}{2(G - E)} \]
\[ t_{1,2} = \frac{-F \pm \sqrt{F^2 - G^2 + E^2}}{(G - E)} \quad (EQ \#3) \]

Solving For \( \theta_4 \)

\[ \theta_4 = 2 \tan^{-1}(t_{1,2}) \]

Solving For \( \theta_3 \), use ratio of Y to X

\[
\begin{align*}
\frac{y}{x} & = \frac{-r_3 s_3}{-r_3 c_3} = \frac{-r_1 s_1 - r_4 s_4 + r_2 s_2}{-r_1 c_1 + r_4 c_4 - r_2 s_2} \\
\theta_{3,1,2} & = \tan^{-1} \left( \frac{-r_1 s_1 - r_4 s_4 + r_2 s_2}{-r_1 c_1 + r_4 c_4 - r_2 s_2} \right)
\end{align*}
\]
Appendix B: Velocity Analysis Mathematics

Given: \( r_1 = 32, r_2 = 12, r_3 = 30, r_4 = 26, \theta_1, \theta_2 \)

Find: \( \theta_3, \theta_4 \)

Previously,

Vector Loop Equation: \( r_2 + r_3 = r_1 + r_4 \)

\( x \) \( r_2 \cos \theta_2 - r_3 \cos \theta_3 = -r_1 \cos \theta_1 + r_4 \cos \theta_4 \)

\( y \) \( -r_2 \sin \theta_2 - r_3 \sin \theta_3 = -r_1 \sin \theta_1 - r_4 \sin \theta_4 \)

Take First Time Derivative

\( x \) \( r_2 \omega_2 s_2 + r_3 \omega_3 s_3 = -r_4 \omega_4 s_4 \)

\( y \) \( -r_2 \omega_2 c_2 - r_3 \omega_3 c_3 = -r_4 \omega_4 c_4 \)

Simplify and gather unknowns on Left Hand Side (LHS)

\( x \) \( r_3 \omega_3 s_3 + r_4 \omega_4 s_4 = r_2 \omega_2 s_2 \)

\( y \) \( -r_3 \omega_3 c_3 + r_4 \omega_4 c_4 = r_2 \omega_2 c_2 \)

Simplify, and let:

\( a = r_3 s_3 \quad b = r_4 s_4 \)

\( c = r_2 \omega_2 s_2 \quad d = -r_3 c_3 \)

\( e = r_4 c_4 \quad f = r_2 \omega_2 c_2 \)

Now we have:

\( x \) \( a \omega_3 + b \omega_4 = c \)

\( y \) \( d \omega_3 + e \omega_4 = f \)

Solve for unknowns:

\( \omega_3 = \frac{c - b \omega_4}{a} \)

\( d \left( \frac{c - b \omega_4}{a} \right) + e \omega_4 = f \)

\( \omega_4 (ae - db) = af - dc \)

Therefore:

\( \omega_4 = \frac{af - dc}{ae - db} \quad (EQ \#5) \)

Now, solve for \( \omega_3 \)
\[ \omega_3 = \frac{ce - bf}{ae - db} \] (EQ #6)
Appendix C: Acceleration Analysis Mathematics

Given: \( r_1 = 32, r_2=12, r_3 = 30, r_4 = 26, \theta_1, \theta_2 \)

Find \( \theta_3, \theta_4 \)

Previous Velocity Equations

\[ x) - r_2 \omega_2 s_2 + r_3 \omega_3 s_3 = -r_4 \omega_4 s_4 \]
\[ y) - r_2 \omega_2 c_2 - r_3 \omega_3 c_3 = -r_4 \omega_4 c_4 \]

Take First Time Derivative

\[ x) - r_2 \alpha_2 s_2 - r_2 \omega_2^2 c_2 + r_3 \alpha_3 s_3 + r_3 \omega_3^2 c_3 = -r_4 \alpha_4 s_4 - r_4 \omega_4^2 c_4 \]
\[ y) - r_2 \alpha_2 c_2 + r_2 \omega_2^2 s_2 - r_3 \alpha_3 c_3 + r_3 \omega_3^2 s_3 = -r_4 \alpha_4 c_4 + r_4 \omega_4^2 s_4 \]

Group unknowns on LHS

\[ x) - r_3 \alpha_3 s_3 - r_4 \alpha_4 s_4 + r_4 \omega_4^2 c_4 - r_2 \alpha_2 s_2 - r_2 \omega_2^2 c_2 + r_3 \omega_3^2 c_3 \]
\[ y) r_3 \alpha_3 c_3 - r_4 \alpha_4 c_4 = -r_4 \omega_4^2 s_4 - r_2 \alpha_2 c_2 + r_2 \omega_2^2 s_2 + r_3 \omega_3^2 s_3 \]

Let:

\[ a = -r_3 s_3 \quad b = -r_4 s_4 \quad c = -r_2 \alpha_2 s_2 - r_2 \omega_2^2 c_2 + r_3 \omega_3^2 c_3 + r_4 \omega_4^2 c_4 \]
\[ d = r_3 c_3 \quad e = -r_4 c_4 \quad f = -r_2 \alpha_2 c_2 - r_2 \omega_2^2 s_2 + r_3 \omega_3^2 s_3 + r_4 \omega_4^2 s_4 \]

This Gives:

\[ x) a \alpha_3 + b \alpha_4 = c \]
\[ y) d \alpha_3 + e \alpha_4 = f \]

Solve for unknowns:

\[ \alpha_3 = \frac{c - b \alpha_4}{a} \]
\[ dc - db \alpha_4 + ae \alpha_4 = af \]
\[ \alpha_4(ae - db) = af - dc \]
\[ \alpha_4 = \frac{af - dc}{ae - bd} \quad (EQ \#7) \]

Now we can find that:

\[ \alpha_3 = \frac{ce - bf}{ae - bd} \quad (EQ \#8) \]

Appendix F: Link Mass Calculations

Given: \( D = \text{link diameter}, \ L = \text{link length}, \ \rho = \text{Density} \)

Volume of a cylinder \( V = \frac{\pi}{4} D^2 \cdot L \)

Mass \( M = \rho \cdot V \)

Link 2:

\[
V = \frac{\pi}{4} D^2 \cdot L = \frac{\pi}{4} \cdot 4^2 \cdot 12 = 150.8 \text{ in}^3
\]
\[
M = 0.284 \times 150.8 = 42.8 \text{ lb}_m
\]

Link 3:

\[
V = \frac{\pi}{4} D^2 \cdot L = \frac{\pi}{4} \cdot 4^2 \cdot 30 = 377.0 \text{ in}^3
\]
\[
M = 0.284 \times 377.0 = 107.1 \text{ lb}_m
\]

Link 4:

\[
V = \frac{\pi}{4} D^2 \cdot L = \frac{\pi}{4} \cdot 4^2 \cdot 26 = 326.7 \text{ in}^3
\]
\[
M = 0.284 \times 326.7 = 92.8 \text{ lb}_m
\]

Appendix G: Rotational Moments of Inertia Calculations

Given: \( m = \text{mass}, \ L = \text{link length} \)

Mass Moment of Inertia \( I_{cz} = \frac{m \cdot L^2}{12} \)

Link 2:
\[ I_{GZ} = \frac{m \cdot L^2}{12} = \frac{42.8 \cdot 12^2}{12} = 513.6 \text{ lb} \cdot \text{in}^2 \]

Link 3:

\[ I_{GZ} = \frac{m \cdot L^2}{12} = \frac{107.1 \cdot 30^2}{12} = 8032.5 \text{ lb} \cdot \text{in}^2 \]

Link 4:

\[ I_{GZ} = \frac{m \cdot L^2}{12} = \frac{92.8 \cdot 26^2}{12} = 5227.7 \text{ lb} \cdot \text{in}^2 \]
Appendix H: Link Details
